

PART-I

9)

For actuator, gain is selected as 1 and time constant is selected as 0.05 seconds. As time constant of the actuator is very small compared to the system's time constant (which is bigger than 20 seconds in the scenario where it is smallest), output is not effected much and can be neglected.

Note that scenario is run at 37 m/s set speed and with disturbance is positive 7 degrees (constant).
